

Bouquet Holder

An attachment can be made to hold a bouquet of flowers, to use when attending special events like a wedding. In the example featured here, a regular bouquet holder was used with an attachment made from a low temperature plastic to stabilize the holder in the passive hand. The plastic was heated in hot water and then moulded manually by the prosthetist around the handle of the holder and fits snugly against the artificial hand. It was then allowed to cool and was ready to be used – a very simple and effective solution!
