

Horn Instruments

This simple strap device enables amputees to secure and stabilize the trumpet.

Trumpet

Trombone

The device shown here is simply wire attached to a rod which an amputee can move by placing their residual limb inside the looped end of the wire and using a pull/push motion. Your prosthetist may be able to design a device similar to this.

A stand which attaches to the bell of the trombone rests on the residual limb, allowing an amputee to move the slide with the other hand.
